1 Introduction

Presented report summarizes evaluation of White Rabbit Switch (WRS) firmware resource evaluation. Firmware is evaluated for Xilinx Zynq UltraScale+ (US+) MPSoC XCZU11EG-1FFVC1156E1.

Figure 1: US+ FPGA family resource overview (DS891).

100G Ethernet w/ RS-FEC	0	0	0	0	0	0	0	2	0	2	4

The firmware was supposed to be tested in following configurations:

1. 1G Ethernet - based on current proposed_master branch
2. 1G Ethernet with redundancy support (see 2)
3. 10G Ethernet
4. 10G Ethernet with redundancy support (see 2)

The firmware didn't have to be functional nor did it need to implement.

2 Work done

Build system

Project used to evaluate resource utilisation may be easily rebuild with HDLmake. It required small changes in syn/scb_18ports/Manifest.py file.

Block RAM

Netlist representation of Block RAM was replaced by Xilinx Parametized Macro (XPM). Netlists were removed because they are are not supported by Vivado.

Xilinx primitives

Input and output buffer primitives have been replaced by US+ family counterparts.

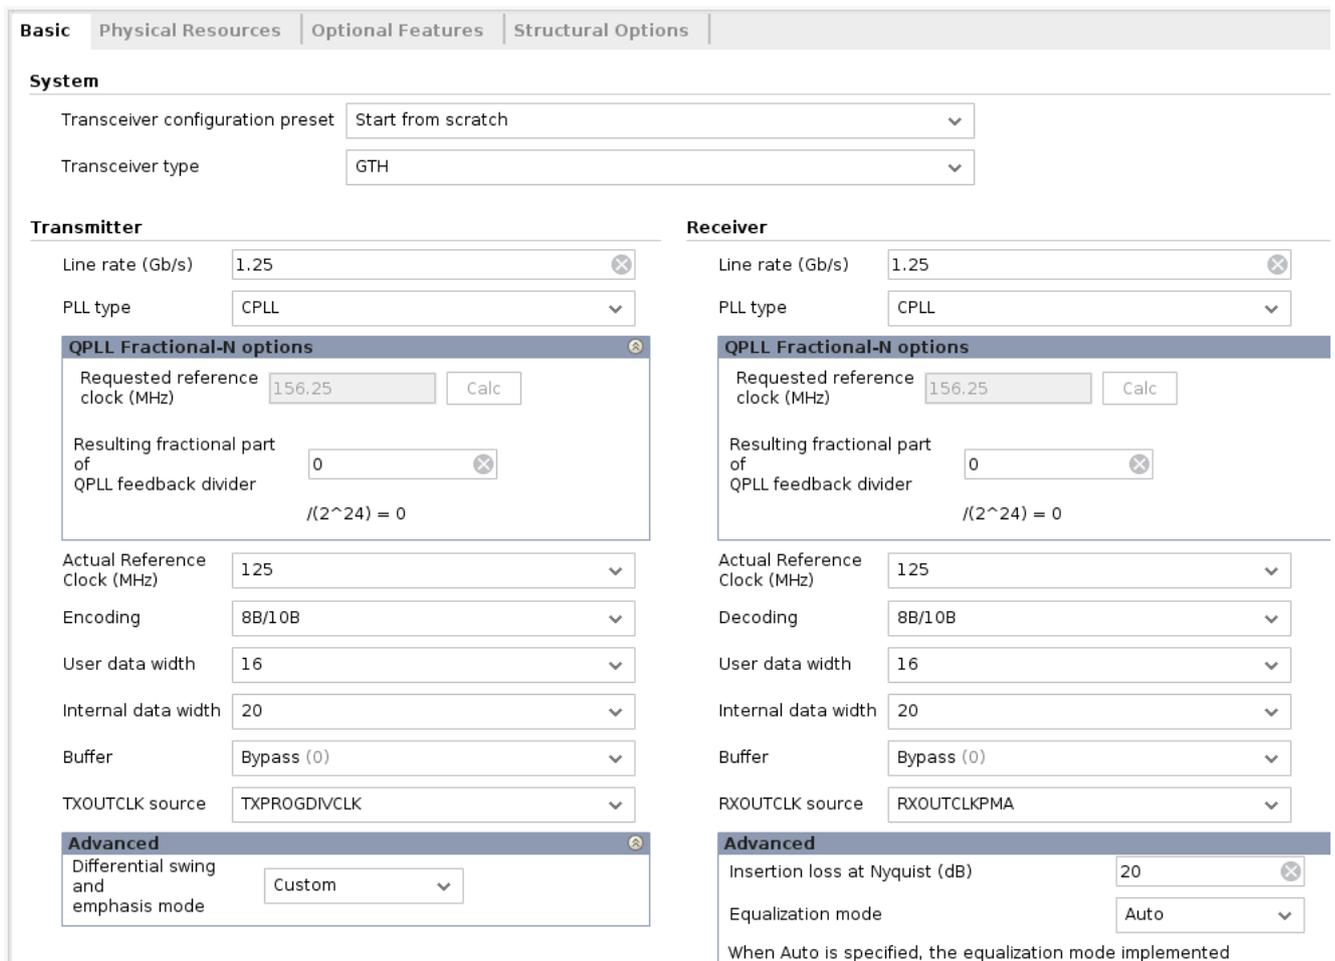

Some changes were also required in block platform/xilinx/oserdes_8_to_1.vhd. Oserdes resolution has increased in US+.

Gigabit transceivers

Original Ethernet phys have been replaced with Xilinx IPcore "UltraScale FPGAs Transceivers Wizard". Separate versions were created for 1G Ethernet (line rate 1.25 Gb/s, 125 MHz clock, 20b internal data width 2) and 10G Ethernet (line rate 12.5, 156.25 MHz clock, 40b internal data width 3).

A generate loop (concatenate_gen) was added to scb_top_synthesis to adjust existing phy interface to IPcore ports. Interconnect between the design and phys is unlikely to be functional, but should prevent Vivado from removing any major components.

Figure 2: Gigabit transceivers configuration

The screenshot displays the configuration interface for Gigabit transceivers, organized into several sections:

- System:**
 - Transceiver configuration preset: Start from scratch
 - Transceiver type: GTH
- Transmitter:**
 - Line rate (Gb/s): 1.25
 - PLL type: CPLL
 - QPLL Fractional-N options:**
 - Requested reference clock (MHz): 156.25
 - Resulting fractional part of QPLL feedback divider: 0
 - Actual Reference Clock (MHz): 125
 - Encoding: 8B/10B
 - User data width: 16
 - Internal data width: 20
 - Buffer: Bypass (0)
 - TXOUTCLK source: TXPROGDIVCLK
 - Advanced:**
 - Differential swing and emphasis mode: Custom
- Receiver:**
 - Line rate (Gb/s): 1.25
 - PLL type: CPLL
 - QPLL Fractional-N options:**
 - Requested reference clock (MHz): 156.25
 - Resulting fractional part of QPLL feedback divider: 0
 - Actual Reference Clock (MHz): 125
 - Decoding: 8B/10B
 - User data width: 16
 - Internal data width: 20
 - Buffer: Bypass (0)
 - RXOUTCLK source: RXOUTCLKPMA
 - Advanced:**
 - Insertion loss at Nyquist (dB): 20
 - Equalization mode: Auto

Redundancy support

Code required to implement link redundancy was developed by Maciej Lipiński. It is available in ohw repository in branches ML-PTP-support-150317 and TRUandRTUandEndpointAndSWcoreAndTATSU.

Figure 3: 10 Gigabit transceivers configuration

Basic	Physical Resources	Optional Features	Structural Options
System			
Transceiver configuration preset		Start from scratch	
Transceiver type		GTH	
Transmitter		Receiver	
Line rate (Gb/s)		12.5	
PLL type		QPLL0	
QPLL Fractional-N options		QPLL Fractional-N options	
Requested reference clock (MHz)		156.25	
Resulting fractional part of QPLL feedback divider		0	
		$/(2^{24}) = 0$	
Actual Reference Clock (MHz)		156.25	
Encoding		8B/10B	
User data width		64	
Internal data width		40	
Buffer		Bypass (0)	
TXOUTCLK source		TXPROGDIVCLK	
Advanced		Advanced	
Differential swing and emphasis mode		Insertion loss at Nyquist (dB)	
Custom		20	
		Equalization mode	
		Auto	
		When Auto is specified, the equalization mode implemented	

Branch TRUandRTUandEndpointAndSWcoreAndTATSU was already merged with proposed master. Following generics had to be activated in scb_top_bare instantiation in order to evaluate resource utilisation of TRU and TATSU components: g_with_TRU, g_with_TATSU.

Branch ML-PTP-support-150317 required merging into proposed_master. Regular merging proved to be difficult, due to multiple merge conflicts. Instead ML-PTP-support-150317 was rebased on proposed master. This way conflicts in consecutive commits could be resolved one by one. A PSU (component that is added in this branch) may be enabled with generic g_with_PSU.

10Gb link

Migration to 10Gb link requires changing reference clock frequency and link data width. Frequency change doesn't effect resource utilisation. Timing is not even verified during synthesis.

Change of the data width requires changes in some parts of the design.

Most of components passes the data as is, so it is sufficient to change record declaration in vhdl packages. Vectors t_wrf_source_out.dat, t_phyif_output.tx_data and t_phyif_input.rx_data were resized from 16 to 64 bytes.

The endpoint on the other hand contains multiple comparisons and assignments that assume certain (16 bit) data width. Changing data width in this component would require rewriting multiple FSM's.

It was decided to instantiate 4 endpoints in parallel instead. Each of the multiplied endpoints processes 16 bit of the 64 data word received from the phys. Other control signals (rx_k, tx_disparity etc) are connected to all 4 endpoints. Data output of the endpoints is concatenated back into 64 bit array. Other outputs of the endpoints are xored in order to make sure that nothing will be over optimised during synthesis. Vector `t_ep_internal_fabric.data` has original 16 bit width.

The interface between original existing signals and multiplied endpoint is located inside `U_Real_Top/gen_endpoints_and_phys_generate` loop.

3 Found issues

Ext PLL

A minimal frequency of MMCM block was increased to 14Mhz in US+ family. A `U_Ext_PLL1` that generated 100 MHz clock from 10 MHz input will not work correctly in US+ FPGA.

Latch

A latch reported by Vivado was fixed in commit `16c02da485ed4aeea17b8c242b52b40d2cc2481c`.

4 Summary

Figures 4, 5, 6 and 7 show resource utilisation estimated by Vivado IDE.

Resource utilisation with 10 Gb links barely reaches 50% on LUT's and 45% on BRAM.

Figure 4: Resource utilisation with 1Gb serial links and without redundancy components.

Resource	Estimation	Available	Utilization %
